is concerned with a compact, low cost microswitch that is
operational with light forces, actuation as low as 150 g, and which
is suitable for mounting directly on or in the presence of or in the
vicinity of an electrical circuit. Prior art microswitches for use with
electrical circuits must be very small, generally requiring
mounting on a substrate or other support with their terminals
positioned away from the circuit to avoid inadvertent contact with
the circuit. Such mounting is often difficult or impractical.
Moreover, such prior art microswitches were more intended as
laboratory or prototype devices and were not intended for or used
in applications in which the switch must be exposed to forces
tending to open it or to close it accidentally. In view of the
foregoing, it is an object of this invention to provide a microswitch
that is particularly useful in applications requiring that it be
mounted within an electrical circuit such that its actuating
members are exposed to light forces acting on the switch. It is
another object of this invention to provide a microswitch that may
be mounted as an integral part of an electrical circuit where it
may be exposed to forces tending to close it inadvertently, such
as might occur in the presence of an electrical fault. It is still
another object of this invention to provide a microswitch
